OPTI 510R: Photonics Syllabus

Instructor:
Professor Khanh Kieu, College of Optical Sciences, Rm 626, kkieu@optics.arizona.edu
Office Hours: Drop-in or by appointment

Lecture Schedule:
Lecture, Monday and Wednesday 11:00am to 12:15pm, Rm 307

Teaching Assistant:
TBD

Course Objectives:
This course has been designed to give an introduction to photonics at the graduate level. From the Photonics Dictionary at photonics.com, Photonics is defined as

> *The technology of generating and harnessing light and other forms of radiant energy whose quantum unit is the photon. The science includes light emission, transmission, deflection, amplification and detection by optical components and instruments, lasers and other light sources, fiber optics, electro-optical instrumentation, related hardware and electronics, and sophisticated systems. The range of applications of photonics extends from energy generation to detection to communications and information processing.*

This course is designed to be device oriented, with many practical examples of photonics components. The students will learn how the devices are made, designed and operated. The course can be broadly divided into two parts. The first part covers fundamentals such as theories of dispersion, absorption and birefringence. Thorough understanding of these concepts is required for the rest of the course. This review will be followed immediately by studies of passive components such as gratings, Fabry Perot filters and Bragg mirrors. We then move to waveguide propagation in planar geometries, specifically integrated optics devices, with discussion of several advanced topics such as arrayed waveguide gratings and silicon photonics. There will be a midterm exam, which will provide students with enough feedback on their performance in order to drop the class if they are doing poorly. The second part of the class covers wave propagation in optical fiber with applications to optical networks, telecommunications, and optical interconnects. Different types of fiber based devices are examined. We will study various types of fiber amplifiers, specialty fibers and nonlinear effects in fibers that impact optical network performance. Many practical aspects of fiber-based devices will be covered including their design, fabrication and packaging; relevant reliability standards will also be introduced. Finally, we will examine different kinds of active lightwave devices including optical interconnects, LEDs, laser diodes and photodetectors.

Lecture topics

       Properties of Light
       Wave Optics
       Interference and Devices
       Diffraction and Devices

Polarization Optics
Planar Waveguides
Optical Fibers
Fiber Dispersion and Compensation Techniques
Fiber Fabrication
Nonlinear Optical Effects in Fibers
Optical Amplifiers
Passive Fiber Components
Lasers
Detectors
Introduction to Optical Network

Grading Policy:

Two Exams		60%
Homework Assignments		40%
	TOTAL	**100%**

Exams:

We plan to have two exams during the semester. The exams will be based on the lectures, homework assignments, and materials in the textbook. Each exam includes materials in the different parts of the class. The first exam will cover the first half of the course, while the second exam covers the second half of the course.

Homework Assignments

There will be a homework problem set assigned approximately every two weeks. The problem set is due in class. The due date will be listed in the problem set handouts. *Late homework will be accepted up to a week after it was due, and will be graded at 50% off. All materials that are over a week late will receive zero credit.* For distance learning students, you can email scanned/electronics copies of your homework to the TA before the deadline. Recording of class lectures will be available online to distance learning students only. Please contact Cindy Robertson (cindyr@optics.arizona.edu).

Textbook:

We have one required textbook for the class:

B. E. A. Saleh and M. C. Teich, "Fundamentals of Photonics," 2nd Edition, John Wiley & Sons, Inc. 2007.

There will be handouts given during class to supplement the materials not in the textbook. Supplements and additional materials are available on the class website (https://wp.optics.arizona.edu/kkieu/opti-510r/) , which will be updated periodically during the semester.

Course Policies:

It is *very important* to attend all lectures. If you must be absent, it is your responsibility to obtain and review the information you missed. The students are encouraged to ask questions

during the lecture. Attendance is not mandatory. If you miss an exam, it may not be made up unless you have a documented medical or family emergency.

If you need to leave the room during lecture, please do so discretely, so that you won't disturb the professor and the students.

You are encouraged to work with each other as a team. You should not, however, copy each others homework.

Additional Information
Academic Integrity
According to the Arizona Code of Academic Integrity (http://dos.web.arizona.edu/uapolicies/cai2.html), "Integrity is expected of every student in all academic work. The guiding principle of academic integrity is that a student's submitted work must be the student's own." Unless otherwise noted by the instructor, work for all assignments in this course must be conducted independently by each student. CO-AUTHORED WORK OF ANY KIND IS UNACCEPTABLE. Misappropriation of exams before or after they are given will be considered academics misconduct.

Misconduct of any kind will be prosecuted and may result in any or all of the following:
* Reduction of grade
* Failing grade
* Referral to the Dean of Students for consideration of additional penalty, i.e. notation on a student's transcript re. academic integrity violation, etc.

Students with a Learning Disability
If a student is registered with the Disability Resource Center, he/she must submit appropriate documentation to the instructor if he/she is requesting reasonable accommodations. (http://drc.arizona.edu/instructor/syllabus-statement.shtml).
